ABSTRACT

This is an era of technological advancement, and nowadays every human being prefers to use the internet to access news and to get updates about their day-to-day lives and the world's news. Using the internet is easy and cheap, and there is no need to waste time trying to find a newspaper to read when you can google it and search for it. But the results of this are kind of risky, as there is widespread dissemination of fake news throughout social media platforms very quickly.

Fake news is made up on purpose by someone who shouldn't be writing it or by someone with an ulterior motive to make money, get power, or help themselves. Most of the time, people write catchy headlines that attract the user. It can be made up on purpose by someone who shouldn't be writing it or by someone with an ulterior motive to make money, get power, or help themselves. Most of the time, people write catchy headlines that attract the user. It can be accidental, but it affects the person who has been the victor, or the person or thing that has been described within that.

The main goal is to detect fake news using machine learning and natural learning. In this document, every topic has been explained.
